Lecture #2 Semiconductor &
Electronic Devices

Instructor: Junrui Liang (梁俊睿)
Sept. 24th, 2021

The Theme Story

Devices (1)

Circuits (4)

Systems (1)

(Pictures are from the Internet)

Study Purpose of Lecture #2

- 哲学 (bao'an) 三问
 - Who are you?
 - Where are you from?
 - Where are you going?

To answer those questions
throughout your life

- In this lecture, we ask
 - Why semiconductor 半导体 can be used to process information?
 - What are the fundamental semiconductor devices 器件?
 - How an integrated circuit (IC) 集成电路 is build?

Lecture Outline

1. The historical ways of information processing
 2. Fundamental circuit components and their dynamics *
 3. Semiconductor
 4. PN junction
 5. Diode
- (break) -----
6. Transistor
 7. Switch and logic gate (digital application)
 8. Linear amplification (analog application)
 9. Integrated circuit manufacturing and the Moore's Law

The history of information processing (calculation)

Digits 手指

Counting rods 算筹

Abacus 算盘

Slide rule 计算尺
(可计算加、减、乘、除、指数、对数等)

Mechanical calculator (computer?) 机械计算器

(Pictures are from the Internet)

Why no longer mechanical calculator?

- Gears 齿轮 are the kernel of many mechanical calculator

(Pictures are from the Internet)

- Difficulty in scaling down

ENIAC - the first electronic computer

- The first programmable, electronic, general purpose **digital computer**
- Able to solve "a large class of numerical problems" through **reprogramming**
- It was **Turing-complete** 图灵完备性
- By the end of its operation in 1956, ENIAC contained
 - 18,000 **vacuum tubes** 真空管
 - 7,200 **crystal diodes** 二极管
 - 1,500 **relays** 继电器
 - 70,000 **resistors** 电阻
 - 10,000 **capacitors** 电容
 - about 5,000,000 hand-soldered joints
 - weighed 27 tons
 - roughly $2.4\text{ m} \times 0.9\text{ m} \times 30\text{ m}$ in size
 - occupied 167 m^2
 - consumed 150 kW of electricity
 - one ENIAC hour $\approx 2,400$ human hours

(Pictures are from the Internet)

The magic of integrated circuit (IC)

(Pictures are from the Internet)

- Core i7 3rd Generation (Nov. 2011)
 - 32 nm process 制程工艺 technology
 - 2.27 billion (2,270,000,000) transistors 晶体管

Moore's Law – The number of transistors on integrated circuit chips (1971-2018)

Moore's law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years. This advancement is important as other aspects of technological progress – such as processing speed or the price of electronic products – are linked to Moore's law.

Electrical circuit

- An electrical circuit consists of various types of **circuit elements** connected in **closed paths** by conductors.
- The **fluid-flow analogy** can be very helpful initially in understanding electrical circuits.

(EE Section 1.2)

Conductor and insulator

Conductor 导体

- The atoms have single (or few) electrons in the outer orbit called **valence electrons** (价电子)
- They might become **free electrodes** (自由电子) and can be moved from one atom to another easily and enhance the movement of electrons.

Insulator 绝缘体

- has many (7-8) electrons in the outer orbit.
- these electrons are very difficult to move from one atom to the other and **resist the movement of electrons**.

Group → 1 ↓ Period	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18
1	H															He

Quiz #3

Semiconductor

• Silicon crystal 硅晶体

Si: Atomic number 14

Crystallization

(Pictures are from the Internet)

After doping

- N-type semiconductor

- Some of the silicon atoms are replaced with P (phosphorus) 磷

(Pictures are from the Internet)

- P-type semiconductor

- Some of the silicon atoms are replaced with B (boron) 硼

How current flows in p-type semiconductors

1. Electrons are drawn to the positive (+) pole 正极 and move to close holes.
2. Then, as the electrons move to vacant holes, new holes are created and then the adjacent electrons move to the new vacant holes again.
3. As this process is repeated, electrons move toward the positive (+) pole, and at the same time, the holes appear to move toward the negative (-) pole 负极.
4. Only electrons are actually moving, but the holes can be considered as having positively charged particles.

When p-type meets n-type

Uni-directional flow

- Flapper valve

- Reversed biasing 反偏

- Forwarded biasing 正偏

Holes ● Electrons ●
Free Electrons • Free Holes •

Diode characteristic

- Solid-state devices 固态器件

- Shockley diode equation

$$I = I_S \left[e^{\left(\frac{V_d}{nV_T} \right)} - 1 \right]$$

- Simplified models

Diode circuits

- Rectifier 整流器

- Peak detector 峰值检测

Other applications of PN junction

- LED (light emitting diode)

- Solar PV (photovoltaics)

Passive and active switches

- Passive
被动

- Active
主动

Electronic
counterpart?

History of transistors

- Transistor (晶体管)
“transfer” 转换 + “resistor” 电阻

- Junction field-effect transistor (JFET) 结型场效应晶体管, was first patented by Heinrich Welker in 1945

History of transistors

- Shockley's **bipolar junction transistor (BJT)** 双极型晶体管 in 1948.

- By the mid-1950s, researchers had largely given up on the FET concept, and instead focused on bipolar junction transistor (BJT) technology

History of transistors

- The **metal-oxide-semiconductor field-effect transistor (MOSFET)** 金属氧化物半导体场效应晶体管 was invented by Mohamed Atalla and Dawon Kahng at Bell Lab in 1959.

- high **scalability**
- much lower **power consumption**
- higher density** than BJT
- possible to build high-density integrated circuits (ICs)

MOSFET operation

- OFF

- ON

MOSFET operation

- Ideal channel

- Actual channel

NMOS & PMOS

NMOS

PMOS

Symbols

- Symbol

The I-V characteristic of a MOSFET

Computation

- Arithmetic

$$5.5 - 3.4 = 2.1$$

$$15 / 3 = 5$$

$$2 + 15 = 17$$

$$3 \times (4+2) = 18$$

25% of 12 is 3

$$\sqrt{9} = 3$$

$$\frac{3}{4} \times 16 = 12$$

- Boolean logic

CMOS & not gate

- CMOS technology
(**Complementary** Metal-Oxide-Semiconductor Transistor,
互补金属氧化物半导体)

BASICS OF CMOS TECHNOLOGY

- Not gate 非门

$$Y = \bar{A}$$

A	Y
0	1
1	0

Logic voltage levels

- How to physically express the virtual concept of logic?

- DC transfer characteristics

- Logic families

Logic Family	V_{DD}	V_{IL}	V_{IH}	V_{OL}	V_{OH}
TTL	5 (4.75–5.25)	0.8	2.0	0.4	2.4
CMOS	5 (4.5–6)	1.35	3.15	0.33	3.84
LVTTL	3.3 (3–3.6)	0.8	2.0	0.4	2.4
LVCMOS	3.3 (3–3.6)	0.9	1.8	0.36	2.7

Other logic gates

- NAND gate 与非门

- NOR gate 或非门

Amplification and CMOS amplifier

- What is an amplifier

- Why we need amplifier

"Give Me a Place To Stand on, and I'll Move the Earth."

- CMOS amplifier

(will be further elaborated in the 6th lecture)
